GENTRAY 3 NDT Inspection Path Programming

Gentray 3 is a comprehensive and high-performance solution for computer aided design and generation of inspection paths on aeronautical and industrial components.

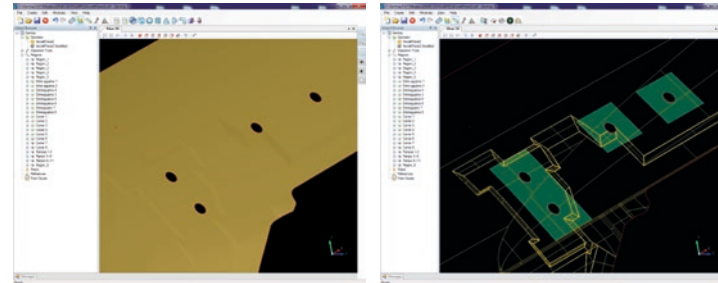

- Loading of CAD files of the components to be inspected.
- Loading of point clouds obtained by digitalization of components and surface reconstruction.
- Full flexibility for inspection path planning design for 3D pulse echo and transmission systems.
- Double inspection tool positioning in 3D following front and rear component surfaces.
- Complete set of strategies for automatic generation of complex trajectories based on CAD geometry. Manual edition available for tuning up the inspections.
- Visual 3D simulation of End-Effectors motion.
- Surface coverage analysis for designed paths.
- Three-point correction for establishing the part position within the workspace.
- Customizable generation of trajectories in any motion controller programming language.
- Inverse kinematic computation capabilities.
- Capabilities for including events or labels everywhere in trajectory programs.
- Full integration with laser teaching system FALCOM-3D®.
- Full integration with NDT suite InspecView® applications for remote generation of trajectories in Re-test, Go-to- point and marking operations.

INSPECTION SCENERY DEFINITION

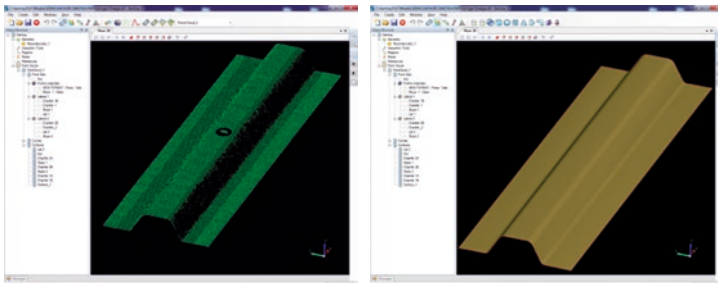

COMPONENT DEFINITION

- Import component CAD files in exchange formats STEP and IGES
- Reconstruction of surfaces from point clouds

REGIONS DEFINITION

- Definition of custom inspection regions in which trajectory will be designed.
- Trajectories belonging to different regions can be included in the same trajectory program.

INSPECTION TOOL MODELING

- Import CAD files defining the shape of inspection tool
- Model the probes at the inspection tool
- Exchange tool models between Gentry 3 projects

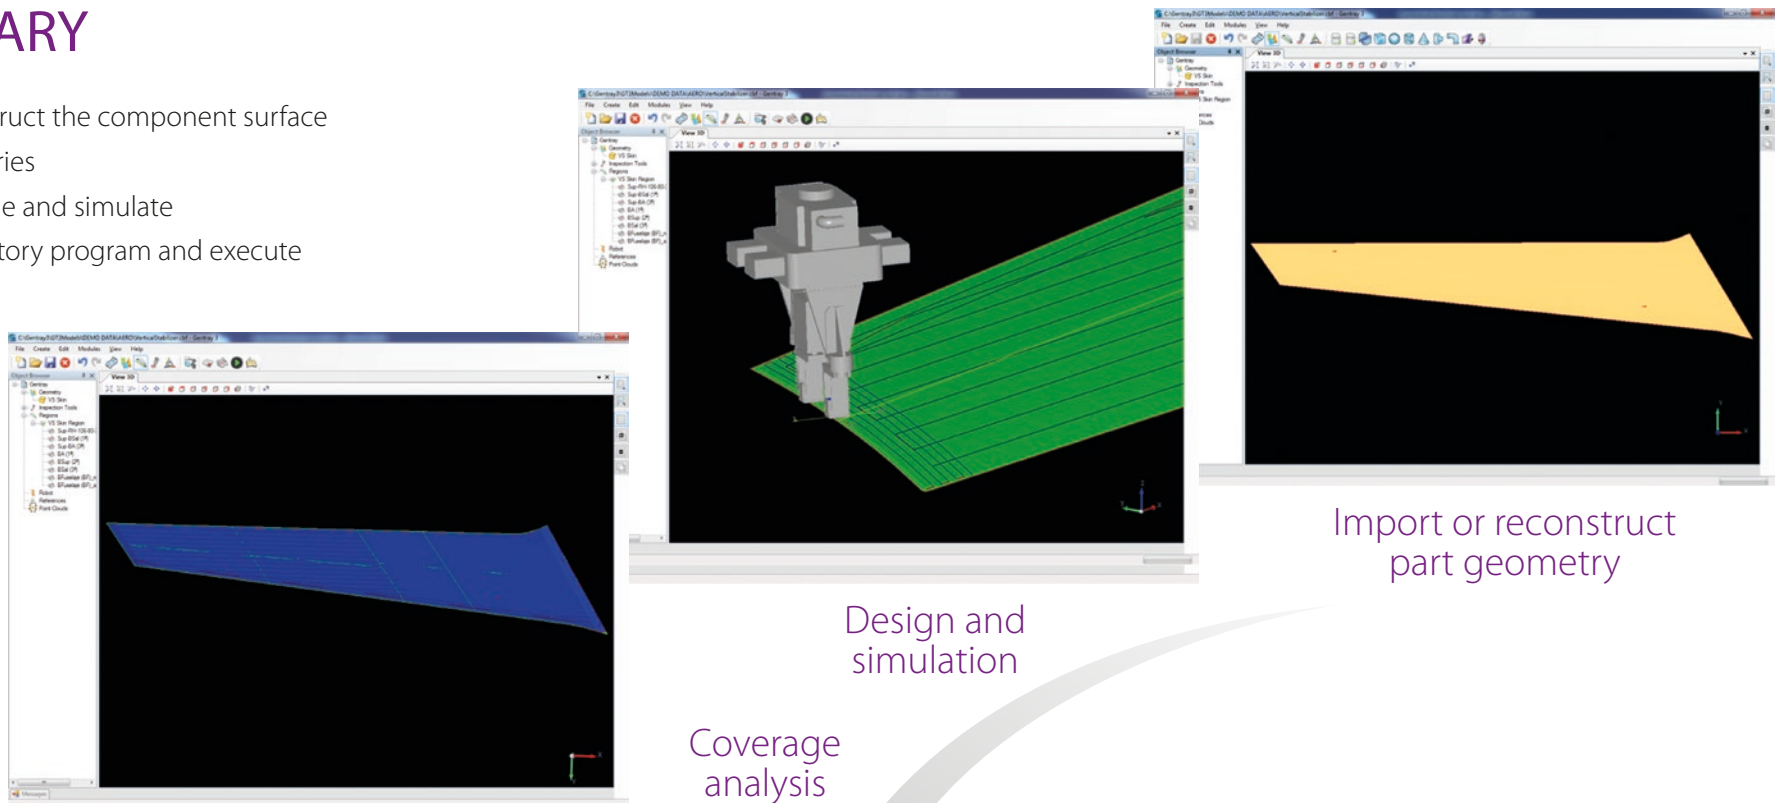

TRAJECTORY DESIGN AND PROGRAM GENERATION

- Design trajectories in the 3D viewer by mean of aided strategies
- Tune-up designed trajectories with a full catalogue of edition and design tools
- Customizable reorientation of inspection tool
- Validate trajectories by simulation and coverage estimation tools
- Double inspection tool positioning in 3D according front and rear surfaces
- Trajectory sampling according to system needs and surface complexity
- Generate machine language trajectory program by processing the sampled trajectory
- Support for kinematic calculations of mechanical equipment

GT3 SUMMARY

- Load or reconstruct the component surface
- Design trajectories
- Analyze coverage and simulate
- Generate trajectory program and execute

Import or reconstruct
part geometry

Design and
simulation

Coverage
analysis

Execution of
inspection
trajectory
